# Gen AI & Classic ML when to use what

July 2024 Felix Wick

#### ChatGPT ~

#### text generation

This code uses PyTorch to implement the policy gradient method (REINFORCE algorithm) to solve the CartPole problem. The policy network is defined as a simple feedforward neural network, and the training loop updates the policy network parameters to maximize the expected reward. Finally, it evaluates the learned policy by running it for 100 episodes and prints the average reward. Adjust hyperparameters and network architecture as needed for better performance.

Can you extend this to an actor-critic method?

Certainly! Here's an extension of the previous rate using the actor-critic method to solve the CartPole problem

ChatGPT can make mistakes. Check important info

#### **ChatGPT**

**BERT family** 

#### image synthesis

Prompt: Epic anime artwork of a wizard atop a mountain at night casting a cosmic spell into the dark sky that says "Stable Diffusion 3" made out of colorful energy

#### Stable Diffusion 3 — Stability AI

#### text-to-video

Prompt: A stylish woman walks down a Tokyo street filled with warm glowing neon and animated city signage. She wears a black leather jacket, a long red dress, and black boots, and carries a black purse. She wears sunglasses and red lipstick. She... +

Track

## Ladder of Generalization

classic ML: feature engineering

deep learning: feature learning
(hierarchy of concepts learned from raw
data in deep graph with many layers)

source

. .

learning

## Structured/Tabular vs Unstructured Data

unstructured data: homogenous

- → deep learning rules
- → allows transfer learning (foundation models in CV and NLP)

ImageNet

The Lord of the Rings

Article Talk.

From Wilkpedia, the free encyclopedia
(Redirected from Lord of the rings)

This article is about the book. For other uses, see The Lord of the Rings (disambiguation).

"War of the Rings is required them. For other uses, see Wire of the Rings (disambiguation).

"The Lord of the Rings is one spit high streating rowelly by the English author and scholar. J. R. R.
Toblen. Set in Middle-earth, the story began as a sequel to Toblerin 1907 children's book. The
Hobbit, but eventually developed into a much larger work. Wither in stages between 1937 and
1949, The Lord of the Rings is one of the best-selling books ever written, with over 150 million
copies sold;"

The title refers to the story's main antagonist, "If Sauron, the Dunk Lord who is an earlier age
created the One Rings to use the work. From bromely seleprings in the Sikra, a notical land
reminiscent of the English countryside, the story ranges across Middle-earth, following the quest to
destrop the One Ring, seen mainly through the eyes of the hobbits Frodo, shar, a hobbit land
climit, who unlike in order to nally the Price Peoples of Middle-earth against Sauron's armies and
give Frodo a chance to destroy the One Rings in the fire of Mixent Doors.

Although redirections are the Mixent Country and the other hones of the Rings in the fire of Mixent Doors.

Although redirections are the Rings and the Mixent Doors.

Although redirections are the Rings and the Rings of the Rings in the fire of Mixent Doors.

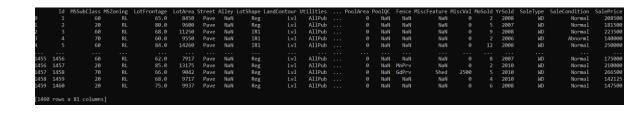

Although redirections are the Rings and the Rings and Society.

Although redirections are the Rings and the Rings and R

Almougn orden instaleney calced a trilogy, the visit was intended by loosen to be one volume in the evolution set during with The Simmellion (1917 in Per economic ceasions, The Lord of the Rings) with first published over the course of a year from 20 July 1934 to 20 October 1955 in three volumes rather than one<sup>2014</sup> funder the titles the Fellowship of the Rings, The Nic Towers, and The Return of the King, The Simmellion appeared only after the author's death. The work is divided internally this six books, how per volume, with several appendices of background material; "These three volumes were later published as a boxed set, and even finally as a single volume, following the author's circinal stimp."

structured data: heterogenous

- → feature engineering needed
- → deep learning loses its advantage over shallow methods
- → e.g., gradient boosting still used a lot

# Transfer Learning

#### idea:

- generic pre-training of foundation models on huge data sets
- subsequent fine-tuning for specific tasks on small(er) data sets
   (usually done with deep learning methods, using its compositional nature)

## very successful for:

- computer vision (e.g., object classification)
- language models (e.g., BERT, GPT)

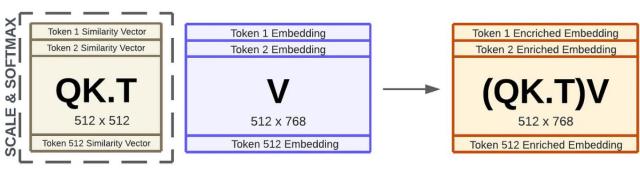

not (yet) for tabular data (due to its notorious heterogeneity)

## Language Models: Contextual Semantics

- self-supervised learning: e.g., next/masked-word prediction
- tokenization: split text into chunks (e.g., words)
- semantics by means of vector embeddings: e.g., via bag-of-words (or end-to-end in transformer)
- positional encoding & embeddings: order of sequence

• contextual embeddings: (self-)attention (weighted averages: influence

from other tokens)

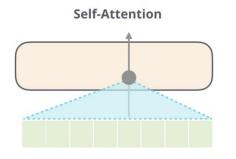

## Encoder vs Decoder LLMs

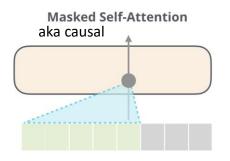

## encoder-only LLMs

- prime example: BERT
- self-supervised pre-training: masked-word prediction
- fine-tuning on downstream tasks (e.g., sequence classification)
- can't generate text
- can't be prompted

## decoder-only LLMs

- prime example: GPT
- self-supervised pre-training: nextword prediction
- instruction tuning (e.g., RL from human feedback)
- generate text: chat bots
- prompt engineering

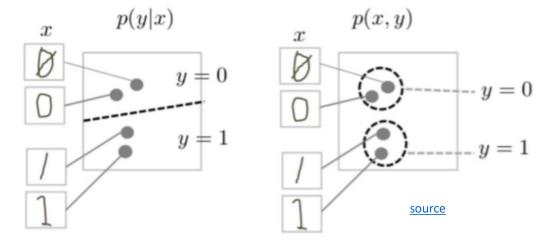

## Generative vs Predictive/Discriminative Models

discriminative models: predict conditional probability P(Y|X)

generative models: predict joint probability P(Y, X)(or just  $P(X) \rightarrow$  unsupervised learning) discriminative model

generative model

task of generative models more difficult: need to model full data distribution rather than merely find patterns in inputs to distinguish outputs

generative models allow to generate new data samples (text, images, video, proteins, ...)

predictive models usually better for predictive tasks, business problems often specific/predictive

## Deep Learning for Generative Al

Depending on the application, there are currently two dominant approaches for generative AI:

text generation: decoder LLMs

• image synthesis: diffusion models

note the difference between image synthesis and multimodal understanding in LLMs (images as additional input sequences to transformer, tokenized by splitting into patches)

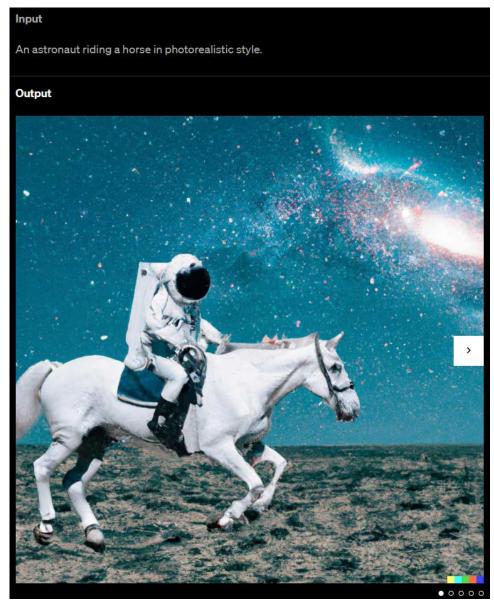

# Image Synthesis

idea: generate new images as variations of training data

usually conditioned on text (prompt) by transformers

compared to text generation, additional mechanism needed (e.g., diffusion) to create more complex structures

example: DALL-E 2

## Text Generation

in-context learning as alternative to fine-tuning (new paradigm): feed information into LLM via input prompt (decoder LLMs)

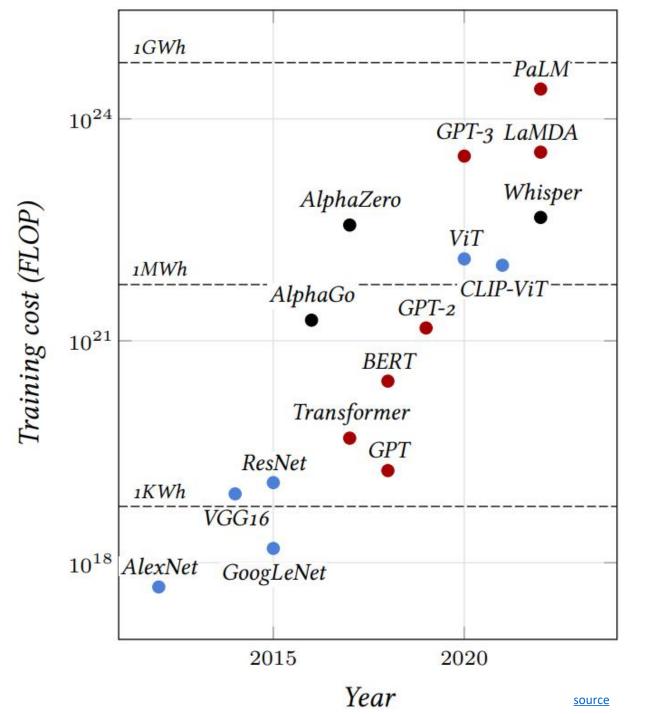

attention to context

typical prompt:

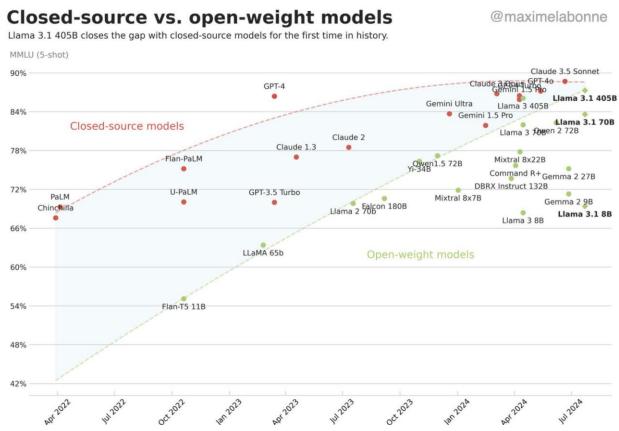

instructions, context (potentially retrieved), query, output indicator

enables multi-task capabilities (all of ML before was only narrow tasks)

→ assistants

# (open-source) SOTA (July 2024): Llama 3

## Some LLM Numbers

#### example Llama 3 405B:

vocabulary size (tokens): 128K

• embedding/model dimensions: 16,384

• parameters: 405B factor less than 40

• training tokens: 15.6T → a lot of memorizing

context length/window (tokens): 128K

• training hardware: 16K GPUs (H100)

## LLM Agents

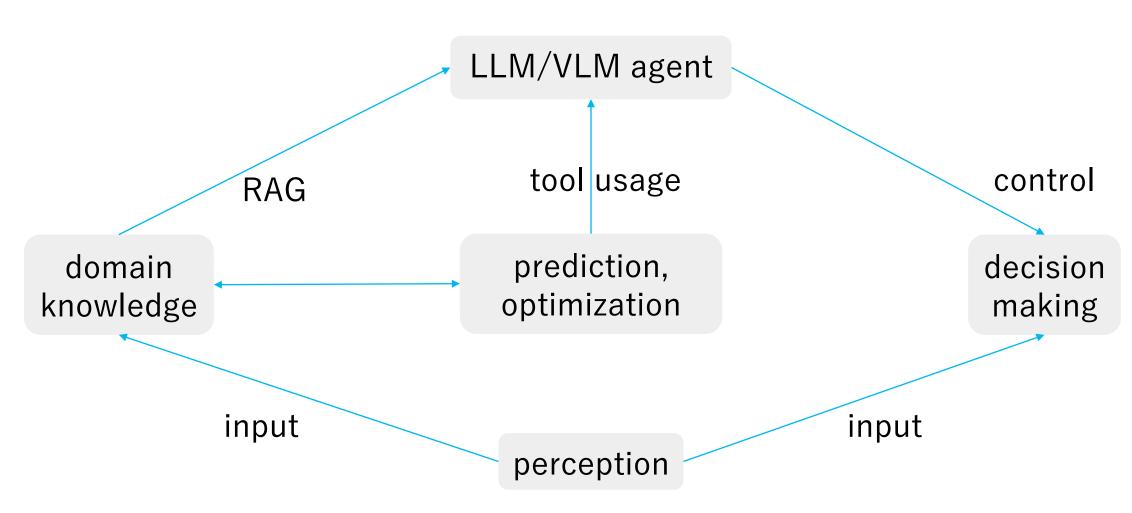

current AI good at learning statistical patterns and making predictions

but no real "understanding", and limited reasoning and planning capabilities

desired agent capabilities:

- planning (LLM: decomposition of complex issue in multiple simple steps)
- tool use (LLM: use predictive models for numerical/optimization tasks)
- reflection
- collaboration with other agents

## Goal: Autonomous End-to-End Workflow

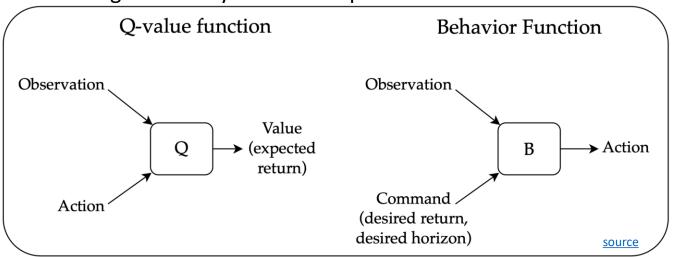

# Sequential Decision Making

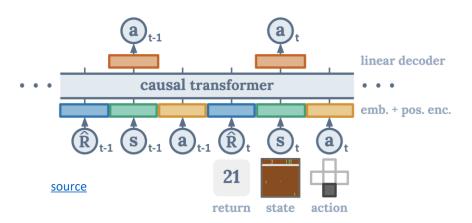

typically, domain of reinforcement learning sequence modeling as alternative:

- generative: transformer decoder to autoregressively model trajectories
- credit assignment directly via self-attention: state-return associations
- desired return tokens as prompt for action generation

overcoming the deadly triad of deep RL:

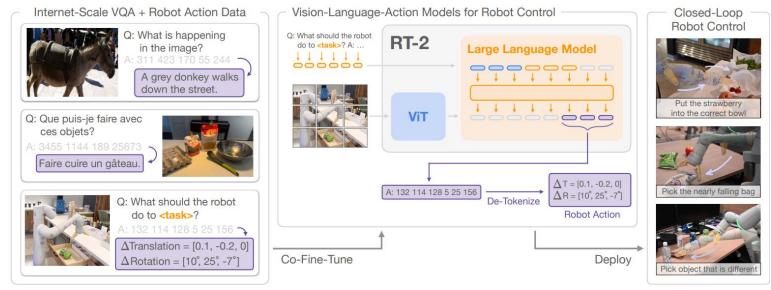

#### **Decision Transformer:**

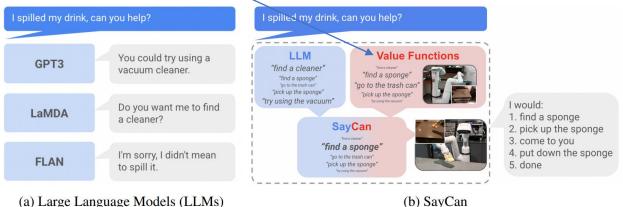

# Robotic Control generated by LLMs/VLMs
